CLIMATE CHANGE AND SMART TECHNOLOGY

The group, consisting of Rubbie Lise and Precyla, presented a short dialogue in podcast form about climate change and its challenges in their show.

Climate change is one of the biggest problems in the world today. It is the increase of Earth's temperature caused by pollution and greenhouse gases.

Climate change is mainly caused by human activities. Cars, factories and planes produce a lot of CO₂. As a result, the Earth becomes warmer. This causes serious problems like melting ice, rising sea levels and extreme weather.

They found the theme very enlightening because it largely affects our planet every day. It helped them become aware of the issues involved and think about solutions.

However, smart technology can help fight climate change. For example, solar panels and wind turbines produce clean energy. Electric cars reduce pollution. Recycling also helps reduce waste and protect the environment.

In conclusion, technology can help reduce climate change, but people must also change their habits. Together, we can protect our planet.
